## Chapter 09: Social networks

Version: May 12, 2014

vrije Universiteit amsterdam

### Contents

Chapter	Description		
01: Introduction	History, background		
02: Foundations	Basic terminology and properties of graphs		
03: Extensions	Directed & weighted graphs, colorings		
04: Network traversal	Walking through graphs (cf. traveling)		
05: Trees	Graphs without cycles; routing algorithms		
06: Network analysis	Basic metrics for analyzing large graphs		
07: Random networks	Introduction modeling real-world networks		
08: Computer networks	The Internet & WWW seen as a huge graph		
09: Social networks	Communities seen as graphs		

2/33

Introduction
Observation
Observation
Sociologists have always been interested in social structures:
<ul><li>formation of groups</li></ul>
<ul> <li>influence relationships</li> </ul>
ties of families and friends
<ul><li>(dis)likings in groups of people</li></ul>
Observation
Graphs form a natural way for modeling social structures
<ul> <li>Sociograms and blockmodeling</li> </ul>
<ul> <li>Basic concepts: balance, cohesiveness, affiliation networks</li> </ul>
Equivalence

4/33

Example: Workers on strike Russ Utrecht ○ Quint Union negotiators Ozzie Carlos Lanny Alejandro Domingo John Mike Hal Eduardo Gill Frank 🖯

### Example: The influence of the Medici's Giovani di Bicci created the Medici Bank and became very rich. His son, Cosimo de' Medici, is the actual founder of the Medici dynasty. Cosimo made sure that the right people got married to each other, resulting in more power. Guadagni Bischeri Lambertes Pucci Strozzi Albizzi Castellan Ridolfi Medici Ginori - Pazzi Salviati •

### Observation

The Strozzi family was richer and had more representatives in the local legislature. Yet the Medici's power surpassed that of the Strozzi's.

Reconsider the betweenness centrality:

$$c_B(u) = \sum_{x \neq y \neq u} \frac{|S(x, u, y)|}{|S(x, y)|}$$

with

- S(x, u, y) is collection of shortest (x, y) paths containing u
- S(x,y) is set of shortest paths between vertices x and y.

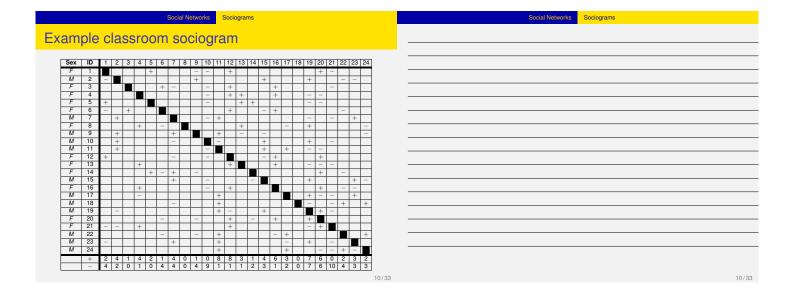

Example: The influence of the Medici's **Normalization** Normalize  $c_B(u)$  by the maximum possible pairs of families that u can connect:  $\binom{n-1}{2}$  $c_B(Medici) = 0.522 \text{ whereas } c_B(Strozzi) = 0.103$ 

Starters: sociograms

Already early in the 1930s Jacob Moreno introduced graph-like representations for social structures and suggested that they could be used for discovering new features.

### Sociograms in the classroom

In order to get an impression of how a class operates, teachers can ask their pupils to list the three classmates they (dis)like the most.

(largest Strongly Connected Component)

### **Eccentricity**

Recall: Eccentricity *u* is maximal minimal distance to other vertices

Child:	1	2	4	5	7	9	11	12
Ecc.:	5	6	6	4	7	7	7	5
Child:	13	14	15	16	17	19	20	23
Ecc.:	6	3	6	5	6	5	4	6

### **Observations**

Child #14 is one of the few nominating a boy *and* a girl. She also seems to be "in the middle."

13/33

### \_\_\_\_

### Concentrate on SCC

### Closeness

**Recall:**  $c_C(u) = \frac{1}{\sum_{v \in V(G)} d(u,v)}$ 

Child:	1	2	4	5	7	9	11	12
Close:	.23	.21	.18	.25	.18	.18	.18	.22
Child:	13	14	15	16	17	19	20	23
Close:	.18	.30	.21	.21	.21	.25	.25	.21

### Observation

The closeness confirms that child #14 is close to everyone.

1/33

### Social Networks

### Sociograms

### Concentrate on SCC

### Betweenness

Child:	1	2	4	5	7	9	11	12
Betw.:	.140	.153	.050	.105	.083	.007	.155	.220
Child:	13	14	15	16	17	19	20	23
Betw.:	.016	.054	.083	.140	.017	.466	.469	.029

### Observation

The picture has changed dramatically: child #14 may be close, but her importance should be questioned.

5/33 15/3

G is simple and (strongly) connected. S(x,y) is set of shortest paths between x and y.  $S(x, u, y) \subseteq S(x, y)$  paths that pass through u. Betweenness centrality:  $c_B(u) = \sum_{x \neq y \neq u} \frac{|S(x,u,y)|}{|S(x,y)|}$ .

Prestige **Definition (Degree prestige)** 

# Let D be a directed graph. The degree prestige $p_{deg}(v)$ of a vertex

 $v \in V(D)$  is defined as its indegree  $\delta^-(v)$ .

### **Definition (Proximity prestige)**

Let *D* be a directed graph with *n* vertices. The influence domain  $R^-(v)$ is the set of vertices from where v can be reached through a directed path, that is,  $R^-(v) = \{u \in V(D) | \exists (u, v)\text{-path}\}$ . The proximity prestige:

$$\rho_{prox}(v) = \frac{|R^{-}(v)|/(n-1)}{\sum_{u \in R^{-}(v)} d(u,v)/|R^{-}(v)|}$$

### Ranked prestige

### Definition

Consider a simple directed graph D with vertex set  $\{1, 2, ..., n\}$  with adjacency matrix **A** The ranked prestige of a vertex k is:

$$p_{rank}(k) = \sum_{i=1,i \neq k}^{n} \mathbf{A}[i,k] \cdot p_{rank}(i)$$

### Simple example

ID	Α	В	С
Α	_	0.5	0.4
В	0.1	_	0.6
С	0.9	0.5	_

$$\begin{array}{lcl} p_{rank}(A) & = & 0.5 \cdot p_{rank}(B) + 0.4 \cdot p_{rank}(C) \\ p_{rank}(B) & = & 0.1 \cdot p_{rank}(A) + 0.6 \cdot p_{rank}(C) \\ p_{rank}(C) & = & 0.9 \cdot p_{rank}(A) + 0.5 \cdot p_{rank}(B) \end{array}$$

 $\mathbf{ID}[i,j]$ : how much is i appreciated by j?

# Computing ranked presitige

### Some simple rewriting

$p_{rank}(A)=0.5 \cdot p_{rank}(B)+0.4 \cdot p_{rank}(C)$	$x = 0.5 \cdot y + 0.4 \cdot z$ (1)
$p_{rank}(B)=0.1 \cdot p_{rank}(A) + 0.6 \cdot p_{rank}(C)$	$y = 0.1 \cdot x + 0.6 \cdot z$ (2)
$p_{rank}(C)=0.9 \cdot p_{rank}(A) + 0.5 \cdot p_{rank}(B)$	$z=0.9 \cdot x + 0.5 \cdot y$ (3)

### Some simple substitutions

- Substitute (2) into (3)
- 2 Substitute (3) into (2)

### Results

$$x = 0.52$$
  $y = 0.48$   $z = 0.71$ 

19/33

Structural balance

### Basic idea

Consider **triads**: potential relationships between triples of social entities, and label every relationship as positive or negative. We then consider **balanced** triads.

A-B	В-С	A-C	B/I	Description
+	+	+	В	Everyone likes each other
+	+	-	ı	Dislike A–C stresses relation B has with either of them
+	-	+	Τ	Dislike B–C stresses relation A has with either of them
+	-	-	В	A and B like each other, and both dislike C
-	+	+	Τ	Dislike A–B stresses relation C has with either of them
_	+	-	В	B and C like each other, and both dislike A
-	-	+	В	A and C like each other, and both dislike B
-	-	-	ı	Nobody likes each other

20/33 20

Structural balance: signed graphs

### **Definition**

A **signed graph** is a simple graph G in which each edge e is labeled with either a positive ("+") or negative ("-") sign, sign(e).

### **Definition**

The **product of two signs**  $s_1$  and  $s_2$  is again a sign, denoted as  $s_1 \cdot s_2$ . It is negative if and only if *exactly one* of  $s_1$  and  $s_2$  is negative. The **sign of a trail** T is the product of the signs of its edges:  $sign(T) = \Pi_{e \in E(T)} sign(e)$ .

### **Definition**

An undirected signed graph is balanced when all its cycles are positive.

/33 21/33

Balanced networks: special characterization	
Theorem	
An undirected signed complete graph G is balanced if and only if $V(G)$ can be partitioned into two disjoint subsets $V_0$ and $V_1$ such that each negative-signed edge is incident to a vertex from $V_0$ and one from $V_1$ , and each positive-signed edge is incident to vertices from the same set.	
More formally	
Let $E^-(G)$ be the edges with negative sign, and $E^+(G)$ the ones with positive sign. Then, $E^-(G) = \{\langle x,y \rangle   x \in V_0, y \in V_1 \}$ and $E^+(G) = \{\langle x,y \rangle   x,y \in V_0 \text{ or } x,y \in V_1 \}.$	
Proof: $V$ can be properly partitioned $\Rightarrow G$ is balanced	
Every cycle in $G$ contains an even number of edges from $E^-(G)$ . All other edges have positive sign. $G$ must be balanced.	
other edges have positive sign. O must be balanced.	22/33

Balanced networks: general characterization	
Theorem	· -
An undirected signed graph G is balanced if and only if $V(G)$ can be	
partitioned into two disjoint subsets V <sub>0</sub> and V <sub>1</sub> such that	
$E^-(G) = \{\langle x, y \rangle   x \in V_0, y \in V_1 \}$ and	
$E^+(G) = \{\langle x, y \rangle   x, y \in V_0 \text{ or } x, y \in V_1 \}.$	
<b>Proof:</b> $V$ can be properly partitioned $\Rightarrow G$ is balanced	
• Add $e = \langle u, v \rangle$ to $G$ , with $u, v$ nonadjacent	
• $u$ and $v$ in same subset $\Rightarrow sign(e)$ becomes positive, otherwise	
negative.	· ·
<ul> <li>Continue until reaching complete signed graph G*.</li> </ul>	
• We know $G^*$ is balanced $\Rightarrow G$ is balanced.	

Social Networks Basic concepts	Social Networks Basic concepts
Balanced networks: general characterization	
Proof: $G$ is balanced $\Rightarrow V$ can be properly partitioned	
Assume G is connected. Prove by induction on number of edges	
m.	
• Trivially OK for $m = 1$ . Assume correct for $m > 1$ edges.	
• Consider nonadjacent vertices $u$ and $v$ : all $(u, v)$ -paths have the same sign. Add $e = \langle u, v \rangle$ with $sign(e)$ the same as a $(u, v)$ -path.	
<ul> <li>New cycle C will consist of e and a (u, v)-path P from G.</li> </ul>	
• $sign(C) = sign(e) \cdot sign(P)$ , and $sign(e) = sign(P) \Rightarrow C$ must be positive.	
• Continue until reaching complete graph $G^*$ , and subsequently partition $V(G^*)$ .

Social Networks Basic concepts	Social Networks Basic concepts
Checking for balance	
Algorithm (Balanced graphs)	
Consider an undirected signed graph G. $N^+(v)$ is the set of vertices adjacent to $v$ through a positive-signed edge. $N^-(v)$ is analogous. Let	
I be the set of inspected vertices so far.	
The the set of inspected vertices so lar.	
Select an arbitrary vertex $u \in V(G)$ and set $V_0 \leftarrow \{u\}$ and $V_1 \leftarrow \emptyset$ .	
Set $I \leftarrow \emptyset$ .	
Select arbitrary vertex $v \in (V_0 \cup V_1) \setminus I$ . Assume $v \in V_i$ .	
• For all $w \in N^+(v)$ : $V_i \leftarrow V_i \cup \{w\}$ .	
• For all $w \in N^-(v) : V_{(i+1) \mod 2} \leftarrow V_{(i+1) \mod 2} \cup \{w\}.$	
• Also, $I \leftarrow I \cup \{v\}$ .	
If $V_0 \cap V_1 \neq \emptyset$ stop: G is not balanced. Otherwise, if $I = V(G)$ stop:	
G is balanced. Otherwise, repeat the previous step.	

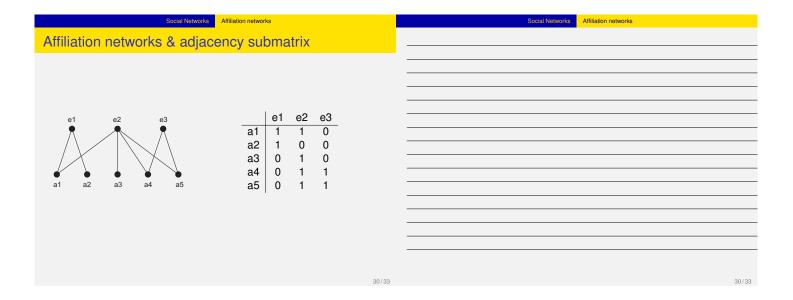

Affiliation networks

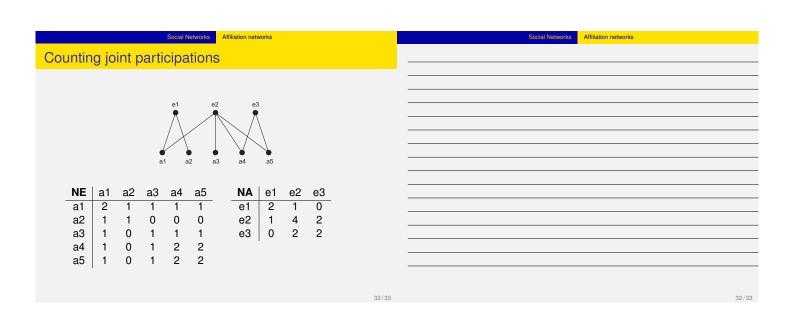

Basic idea

Social structures are assumed to consist of actors and events. Actors are tied to each other through their participation in an event. Two events are bound through the actors that participate in both events  $\Rightarrow$  two-mode networks.

Observation

Affiliation networks are naturally represented as bipartite graphs: Let  $V_A$  represent the actors and  $V_E$  the events. Edge  $(v_a, v_e)$  if actor a participates in event e.
